19. ABSTRACT (Continue on reverse if necessary and identify by block number) This report presents a photographic record of the archetypal buildings, structures, and equipment of the World War II Ordnance Department's government-owned, contractor-operated (GOCO) industrial facility, the Badger Army Ammunition Plant, at Baraboo, Wisconsin. This photographic documentation was completed under partial fulfillment of an Army Materiel Command (AMC) Legacy Resource Program demonstration project for assistance to small installations and in fulfillment of the 1993 Programmatic Agreement among the AMC, the Advisory Council on Historic Preservation, and Multiple Historic State Historic Preservation Officers concerning the program to discontinue maintenance, or dispose, of particular GOCO properties. The objective of the project was to photographically record World War II-vintage equipment and buildings, some of which housed different stages of the ammunition manufacturing process and were of the same architectural design. Modern buildings and equipment are not included in this document. Efforts were made to arrange the photographs in the order of ammunition manufacture and facility processes; however, this presentation should not be perceived as a complete chronological sequence for ammunition manufacturing during World War II. The buildings photographed in this document are classified as under either "stand-by" or "layaway" status. The active buildings depicted in this volume are of an insensitive and/or "safe" nature and include Administration and Shop buildings.

I.

INTRODUCTION

This report presents a photographic recordation of the archetypal buildings, structures, and equipment of the World War II Ordnance Department's government-owned, contractor-operated (GOCO) industrial facility, the Badger Army Ammunition Plant, Baraboo, Wisconsin. Geo-Marine, Inc. was contracted by the U.S. Army Corps of Engineers, Fort Worth District, to undertake this project in September of 1993. Duane E. Peter, Director of the Cultural Resources Division of Geo-Marine, Inc., acted as Principal Investigator for the project. Kathleen Hiatt completed the photographic field work for the project.

This photographic documentation was completed under Delivery Order No. 14, Contract No. DACA63-93 D-0014, Task C, in partial fulfillment of an Army Materiel Command (AMC) Legacy Resource Program demonstration project for assistance to small installations. This documentation also represents partial fulfillment of the requirements of the 1993 Programmatic Agreement among the AMC, the Advisory Council on Historic Preservation, and multiple State Historic Preservation Officers concerning the program to discontinue maintenance, or dispose, of particular government-owned properties. This work was conducted in compliance with the National Environmental Policy Act of 1969 (PL 90-190); the National Historic Preservation Act of 1966 (PL 96-515), as amended; the Archaeological and Historic Preservation Act of 1974 (PL 93-291, as amended); and Executive Order No. 11593, "Protection and Enhancement of the Cultural Environment."

In completion of this task, a map showing building numbers; a photographic log; the photographs of various buildings, structures, and equipment; and a brief history of the installation have been included for the Badger Army Ammunition Plant.

II.

PHOTOGRAPHIC RECORDATION LOGISTICS AND METHODOLOGY

The objective of Task C was to photographically record World War II-vintage buildings and equipment. Numerous buildings that housed different stages of the ammunition manufacturing process were of the same architectural design. Accordingly, the order of photographs that follows is based on differences in architectural design, rather than on the step-by-step process of ammunition manufacturing. Modern buildings and necessary equipment in ammunition processing are absent from this photographic account due to their vintage (i.e., replacement equipment, though similar in function and/or design, was not photographed). Ammunition manufacturing is divided into lines according to the type of ammunition being manufactured and by process stages. Additionally, there may be more than one line for the same ammunition type at the same stage. Accordingly, the architectural design of these buildings in different lines is similar, as is their equipment. Photographs of specific building types were not taken from a single line, rather the photographs were taken from any number of lines as directed by the sun angle and physical restrictions. In short, though efforts were made to arrange the photographs in order of ammunition and facility processes, the presentation should not be perceived as a complete and chronological order of ammunition manufacturing.

Equipment was commonly found stored in a different facility than where it was housed when it was in use. Thus, in some cases, equipment that is depicted may not be a part of the process indicated by the building it is in. This is another reason not to take this account as a step-by-step explanation of ammunition plant processes.

Photographs of ammunition buildings and equipment in this account are classified as under either "stand-by" or "lay-away" status. Depicted active buildings are of an insensitive and/or "safe" nature. Such buildings include administration and shop buildings.

Photographic angles were largely dependent upon the angle of the sun and spatial restrictions. Time constraints and work schedules of the escorts did not allow for return visits to buildings that may have been better depicted with a different sun angle. In many cases a preferred angle for photography was impossible due to overhead pipelines, power line poles, and other structures.

Indoor lighting was also a determining factor in photographic results of plant equipment. Electrical power had been shut off to the buildings on lay-away status. Unbarred windows and doors were opened and a camera flash was employed to compensate for poor lighting conditions. Indoor photography of equipment was also controlled by spatial restrictions. It was virtually impossible to photograph tanks spanning two

or more stories. In some instances, walls and other equipment obstructed photographic angles; therefore, photographs of some equipment were not possible.

The age of equipment was questionable. Each piece of equipment has a plant inventory number. An inventory list of the equipment details each piece by its inventory number. However, not every piece of equipment on this list has a manufacture or acquisition date. Increasing the uncertainty of the equipment's vintage was the illegibility, or absence, of the inventory tag. In addition, the equipment inventory list was not exhaustive. The list did not include "installed equipment;" furthermore, the installed equipment was not easily discernible. Equipment installed at the time of the building's construction in many cases has been replaced in recent times. The installed equipment does not have a certain "look" to it, and purchased equipment without an inventory tag may be mistaken as installed equipment. Photographs were taken of all equipment where the age was in question. Thus, the equipment that is found within this account is not definitely World War II equipment, unless a date is listed for that piece. However, the equipment included in this account is representative of the World War II era.

Pieces of equipment were found in various stages of disassembly. These pieces were not photographed unless they retained sufficient physical integrity to indicate their former function. In this account, such pieces are labeled as being in a state of partial disassembly.

Motors, tanks, and pumps are necessary in numerous plant processes. Due to the common function and design of such equipment, a single photograph was taken to represent any number of similar pieces of equipment. A representative unit was selected for its physical integrity and photographic accessibility.

III.

HISTORICAL OVERVIEW

The Badger Army Ammunition Plant is located on 10,565 acres of land in the Merrimac and Sumter townships of Sauk County, Wisconsin, on the west side of the Wisconsin River (Figure 1). The plant was originally planned to have only three lines that would manufacture smokeless powder; however, the plan was later modified. The modification included the addition of double-based smokeless powder and trinitrotoluene (TNT). The revision of the plant plan was due to the Ordnance Department's growing need to increase the number of multi-purpose plants. The diversity of products produced at plants, such as Badger Ordnance Works (its original name), helped to keep the supply of munitions balanced (Thomson and Mayo 1991:111).

The process of site selection was based on several criteria set up by the Ordnance Department. For instance, the site could not have been a coastal area (and in fact, it had to be at least 200 miles away from any U.S. border), for obvious reasons of national defense. The location also could not have been located near a large center of population for safety requirements; however, it had to be located in an area that could recruit a sufficient work force for construction and operation. Among other criteria considered were that the site had to have access to electricity, water, railroads, and highways to ensure a degree of self-sufficiency. Finally, a large tract of land had to be purchased due to the safety regulations that required adequate spacing between production lines and storage facilities (Thomson and Mayo 1991:108-109).

The contract for design, procurement of equipment, training of personnel, and operation was awarded to the Hercules Powder Company, dated January 1, 1942. The Architect-Engineer-Management service contract was awarded to the Mason and Hanger Company of New York, on January 27, 1942. Construction began in February of 1942 and was considered 98.5 percent complete by December 31, 1943; however, construction continued for the duration of World War II, until the plant was put on stand-by status in 1945. The production of oleum began on January 1, 1943, smokeless powder on January 18, 1943, nitrocellulose on March 22, 1943, solvents on January 18, 1943, and rocket powder in March of 1945 (United States Government Document n.d.:54).

The design plan of Badger Ordnance Works was subject to several revisions. The initial design of the plant's layout was based on a grid of self-contained production areas that were connected by a system of roads and rail lines. A diphenylamine plant and the necessary storage, administrative, and acid facilities were also planned (MacDonald and Mack 1984:16). However, during the construction phase, several changes were made to facilitate the changing ordnance demands. The first revision of the plan involved the addition of double-based powder facilities, five lines for the manufacture of TNT, and the necessary facilities to support these production lines. Later, the double-based powder facilities were eliminated from

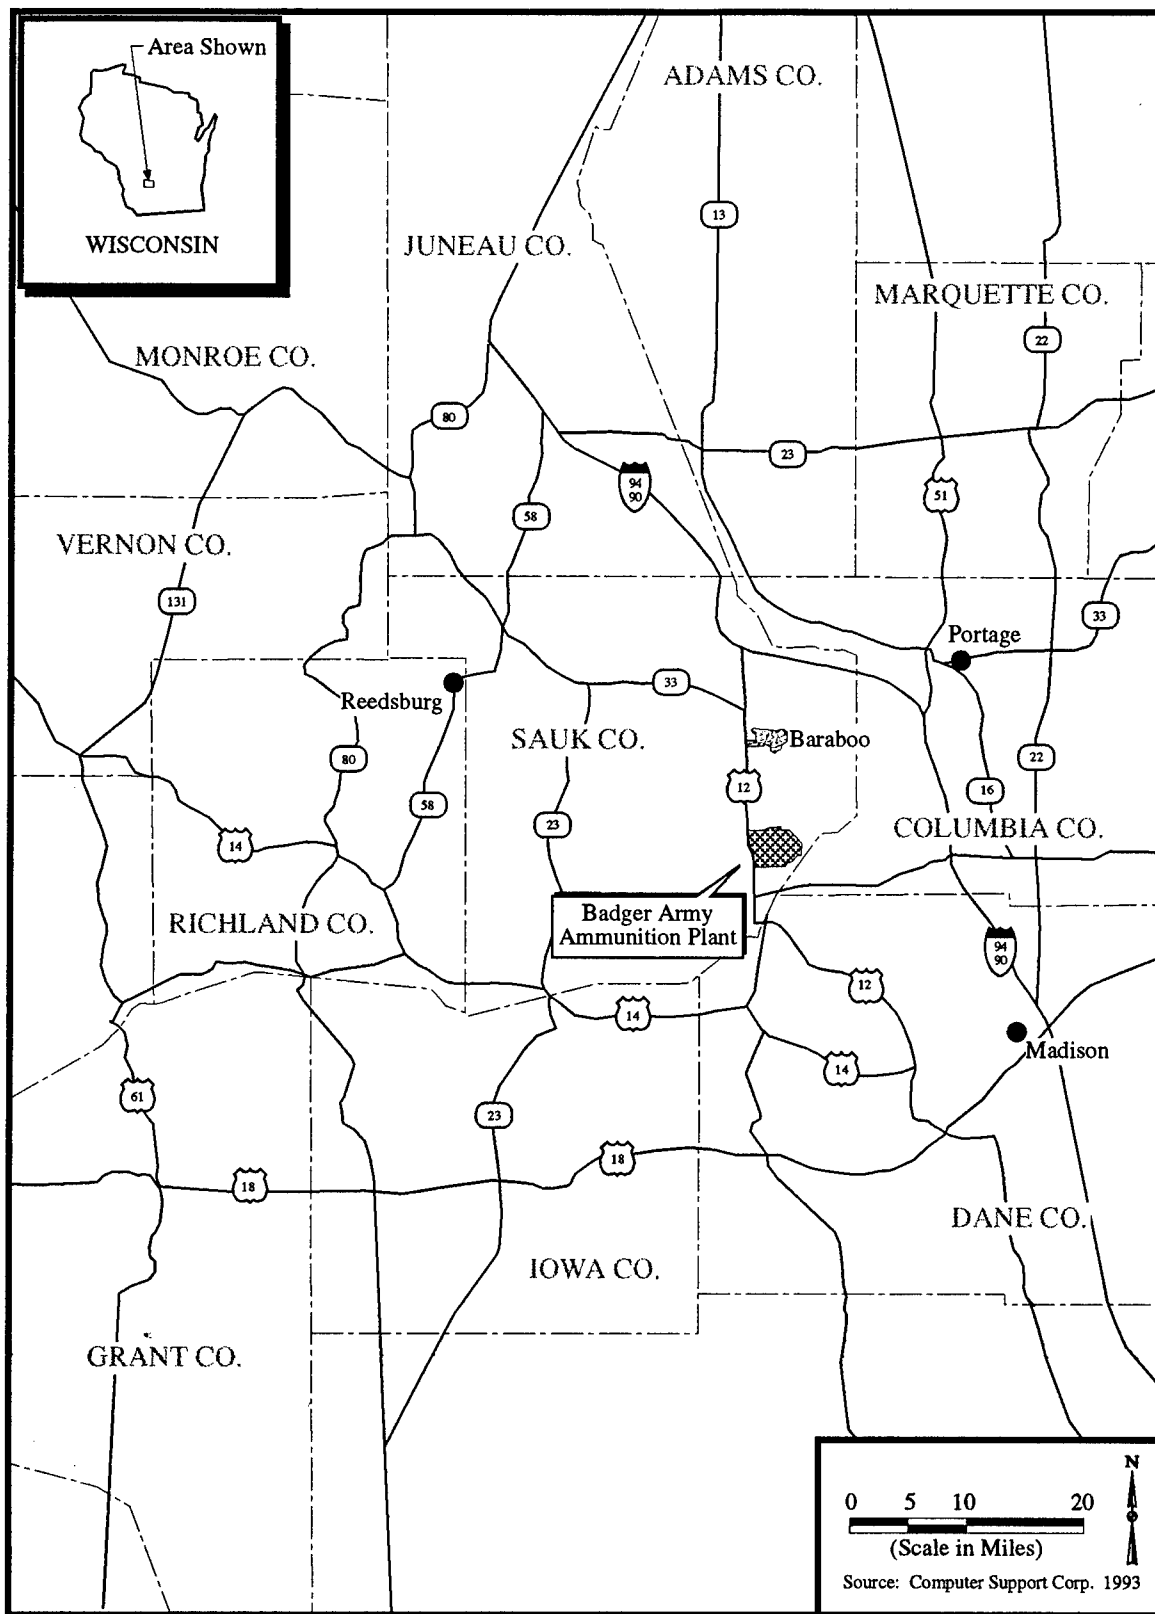

Figure 1. Regional Location of the Badger Army Ammunition Plant.

the plan as well as the diphenylamine plant. Later, the five TNT lines were also eliminated from the plant's plan.

Badger Ordnance Works was converted to primarily a smokeless powder facility, much like the Radford Ordnance Works. During the first part of 1944, construction for rocket powder production facilities was initiated to comply with the peak of the U.S. rocket program, at this point over 18 million pounds of rocket propellant were used each month (Thomson and Mayo 1991:138). The completion of the rocket powder facilities was not final until March 1945. The plant was put on stand-by status on September 7, 1945 (MacDonald and Mack 1984:28).

With the outbreak of the Korean War, and the U.S. involvement in it, the Corps of Engineers awarded a contract to The Fegles Construction Company of Minneapolis, Minnesota, to prepare the plant for production. The plant was reactivated for operation under contract by the Corps of Engineers, awarded to the Liberty Powder Defense Corporation in March of 1951. Production of rocket propellant was started by September 1951, and production of other munitions, such as single- and double-based propellants, was underway three months later (MacDonald and Mack 1984:28).

Expansion of the plant during the Korean War consisted of new facilities for the production of "Western Ball Powder," a type of smokeless powder that eliminated several steps of the standard smokeless powder production process. Approval for construction of the facilities was granted in March of 1954. The H.K. Ferguson Company of Cleveland, Ohio, was awarded the construction contract and completed the job in July of 1955. Production of ball powder, and single- and double-based powder continued at Badger Army Ammunition Plant until it was placed on stand-by status on March 1, 1958.

The plant was not reactivated until January 3, 1966, during the Vietnam War. It was operated under a contract awarded to the Olin Corporation. As in the Korean War, the plant was responsible for the manufacture of single- and double-based powder, as well as ball powder. The plant continued production until June of 1975, when it was placed on stand-by and modernization status by the government. The plant's staff was greatly reduced and operated on stand-by status by the operating contractor, Olin Corporation (MacDonald and Mack 1984:32).
